

Question 1: User controller review

1. Instead of checking isAdmin in the controller, add that responsibility to middleware.
2. To mark user as active or inactive use state pattern instead of if else statement. This can be achieved through using one inout request such as isActive from frontend with check box with boolean value.
3. There is also mistake in getting the input from the request and also quotes in the request parameters as if condition has two single quotes wrapping input and in first elseif there is a double quotes and a single quotes wrapping input. Input value should be wrapped in single quotes.
4. After the controller is finished with the backend process it is not rendering anything to change the front end and the user would be waiting for a success or a failure message.
